

Generate Random Sample Data

Whether in a finance organization or a technical role, most of us have had the need to create sample data to use to test Hyperion systems. In2Hyperion is sharing a tool to make this process more efficient. By defining a numeric range, the number of columns, and the number of rows, an excel spreadsheet will be generated with the appropriate random data.

This tool can be access at <http://www.in2hyperion.com/Tools/RandomNumbers.aspx>.
