PBCS Pro Tip: Manage Multiple Test Accounts with One Gmail Address

Working with Jake Turrell always benefits me in many ways. Jake found a fantastic way to minimize the effort it takes to create test accounts for testing and training Planning users. You no longer have to create new multiple accounts.

> *"During the testing phase of most Planning implementations, developers need to create test user accounts. I typically create at least one test user for each security group so I can verify that the correct access has been assigned. With an on-premises Hyperion Planning implementation, this is easy — simply create user ID's in the Shared Services native directory. With PBCS, creating bulk test ID's can be difficult, as each user ID requires a unique e-mail address. If you need 50 test users, should you create 50 fake/temporary e-mail accounts? Luckily the answer is no."*

Check out how here.

About Jake

Jake Turrell is a Hyperion Architect and Oracle Ace Associate with over 20 years of experience implementing Enterprise Performance Management solutions. Jake's technology career began in the early 90's as a Financial Systems intern at Dell in Austin, Texas, administering IMRS Micro Control (the DOS-based predecessor to Hyperion Enterprise). After working at Dell, Jake joined Ernst & Young's Management Consulting practice where he worked with a variety of technologies. He later returned to the Hyperion world and joined a boutique Hyperion consulting firm in Dallas, Texas.
Jake has spent the last 17 years implementing Hyperion

Planning and Essbase solutions for a variety of clients across multiple industries. Certified in both Hyperion Planning and Essbase, Jake holds a BBA from the University of Texas at Austin.
